- [A slick phone Linux for your pocket PDA? Ooh, don't mind if I do, sir](#) [3]

Sailfish has become the fourth OS to be officially supported on Planet Computing's pocket computer, the Gemini PDA, and eager beavers can download an image from Planet today.

Planet has also released an official Debian distro for download. The keyboard-toting device boots into Android, while support for the Ubuntu flavour of Linux is slated.

Sailfish matters because it's a Linux created primarily with phones and pocket devices in mind ? although it will run on static kit like TVs, too. Nokia launched its first Linux tablet in 2005, and the Maemo platform underpinning it morphed into MeeGo after Intel joined in 2010.
