Key-Based SSH Logins With PuTTY

By *falko*

Submitted by falko on Sunday 10th of December 2006 11:57:49 AM Filed under [Linux](#) [1] [HowTos](#) [2]

[This guide](#) [3] describes how to generate and use a private/public key pair to log in to a remote system with SSH using PuTTY. PuTTY is an SSH client that is available for Windows and Linux (although it is more common on Windows systems). Using key-based SSH logins, you can disable the normal username/password login procedure which means that only people with a valid private/public key pair can log in. That way, there is no way for brute-force attacks to be successful, so your system is more secure.
