Over a year ago, we published a list of the Top 10 Open Source Distros You Haven?t Heard About, and while we also had good suggestions in the comments but the subject of our article today was nowhere in our radar. It goes by the name of FWUL which, interestingly, stands for Forget Windows, Use Linux.
FWUL (Forget Windows Use Linux) is a lightweight open-source Operating System based on Arch Linux that started as an initiative to create a smooth Android-like User Experience for desktop users who had issues with Microsoft Windows.

The same FWUL has an interesting name for an Operating System is the same way it has an interesting back story. The developer always pointed users to Linux whenever the complained about their issues with Windows because he believed that most of them were fixable in Linux.

However, popular distros like Ubuntu and Linux Mint didn’t include everything Android users need. For example, Ubuntu users still need to enter commands to install some apps, flashing Android phones requires the installation of certain drivers, etc.
