Google has promoted today the Chrome OS 73 operating system to the stable channel for Chromebook devices, a release that adds several new features, improvements, bug fixes, and security updates.

Coming hot on the heels of the Chrome 73 web browser, which Google released last week for desktops, including GNU/Linux, macOS, and Windows systems, as well as Android mobile devices, the Chrome OS 73 operating system is here to add a number of enhancements to further enrich your Chromebook experience.

New features include support for sharing files and folders with Linux apps, improved native Google Drive integration in the Files app thanks to the addition of support for the Drive > Computers root, better out-of-memory management, native media controls for the video player, and audio focus support on CrOS.
