At the Google Cloud Next conference Google announced new and expanded partnerships with several open-source businesses. Interesting, several of these have changed their licenses in no small part because they felt Amazon Web Services (AWS) was strip-mining their code.

These partners are MongoDB, Confluent, DataStax, Elastic, InfluxData, Neo4j, and Redis Labs. These new partnerships offer Google Cloud customers managed database services with efforts made to optimize performance and latency between the service and application. Customers will get a unified user interface for app management.
