NOT many Internet enterprises or even protocols outlast the Web. IRC is under attack [2], E-mail is being hijacked by large corporations (the business model of spying), and copyright monopolies compel ISPs to disconnect from USENET. Even without the Web there's a similar problem; not many sites last a decade; some last a few years until interest is lost or life-changing events cause stagnation and ultimately shutdown (it's not cheap to keep a domain registered and it can be technically difficult to keep a host going). Some sites or blogs remain active only for days, weeks, months. Not many sites have lasted 2 decades. Some become dormant and shelved. Some suffer the "Google Plus effect" (host decides it's not viable to carry on hosting, mostly for selfish "business reasons").

Tux Machines remains very active. Every day, almost every hour. Even when we're on holiday (or abroad) we still log in and post the more crucial news. We never wink or lose a heartbeat. Dedication like this becomes almost addictive.

In less than a couple of months the site will turn 15. We're planning to celebrate locally somehow (a little party), knowing that it's a rare event and seeing how the Web becomes just "apps" and "social media" it's hard to guarantee we'll reach 20 (we sure hope so). Over the years we've considered modernising the site (CMS overhaul), but such novelty may entail bloat, speed losses, 'UX' erosion, and a lack of 'traditional' feel, maybe even issues associated with navigation, user familiarity, backward compatibility of URLs (we still use node numbers!) and so on. 2
