Adding to the list of positive changes with GNOME 3.34 due out this September is lowering possible output lag when running GNOME's Mutter on X11/X.Org.

GNOME has experienced higher output lag on X.Org-based sessions rather than Wayland in some configurations. In particular, the higher output lag on X11 could be experienced when dragging around windows and seeing possible lag. Fortunately, as of today's latest Mutter 3.33 series development code, that lag has been addressed.
