Today's release of the openSUSE Leap 15.1 brings professional users, entrepreneurs and Independent Software Vendors updated support for modern hardware.

The release of Leap 15.1 improves YaST functionality and the installer.

"Continuity and stability are what we are providing users with Leap 15.1," said Haris Sehic, a member of the openSUSE community. "With Leap 15, we have introduced a huge number of new features and innovations in security, performance and tool/desktop area. Having in mind how stable, efficient and reliable Leap has become, with this release, we managed to keep the level of quality to the point that our private and Small Business users can, actually more than ever, profit from the enterprise background of an openSUSE Linux Distribution. Let's continue to have a lot of fun!"

Leap releases are scalable and both the desktop and server are equally important for professional's workloads, which is reflected in the installation menu as well as the amount of packages Leap offers and hardware it supports. Leap is well suited and prepared for usage as a Virtual Machine (VM) or container guest, allowing professional users to efficiently run network services no matter whether it's a single server or a data center.
