Having the Plasma and Usability & Productivity sprints held at the same time and place had an unexpected benefit: we were able to come up with a way to make it easier to test a custom-compiled version of Plasma!

Previously, we had some documentation that asked people to create a shell script on their computers, copy files to various locations, and perform a few other steps. Unfortunately, many of the details were out of date, and the whole process was quite error-prone. It turned out that almost none of the Plasma developers at the sprint were actually using this method, and each had cobbled together something for themselves. Some (including myself) had given up on it and were doing Plasma development in a virtual machine.

So we put some time into easing this pain by making Plasma itself produce all the right pieces automatically when compiled from source. Then, we created a simple script to install everything properly.
