Do you have to administrate a computer lab or a whole school network? Would you like to install servers, workstations and laptops which will then work together? Do you want the stability of Debian with network services already preconfigured? Do you wish to have a web-based tool to manage systems and several hundred or even more user accounts? Have you asked yourself if and how older computers could be used?

Then Debian Edu is for you. The teachers themselves or their technical support can roll out a complete multi-user multi-machine study environment within a few days. Debian Edu comes with hundreds of applications pre-installed, but you can always add more packages from Debian.

The Debian Edu developer team is happy to announce Debian Edu 10 Buster, the Debian Edu / Skolelinux release based on the Debian 10 Buster release. Please consider testing it and reporting back to help us to improve it further.
