There have been three openSUSE Tumbleweed snapshots released this week.

The snapshots brought new versions of VLC, Apache, Plopper and an update of the Linux Kernel.

Snapshot 20190824 delivered a fix that was made to the swirl option, which produced an unexpected result, with the update of ImageMagick's 7.0.8.61 version. Improved adaptive streaming and a fix for stuttering for low framerate videos became available in VLC 3.0.8; 13 issues, including 5 buffer overflows we fixed and 11 Common Vulnerabilities and Exposures were assigned and addressed in the media player version. More than a handful of CVEs were addressed with the apache2 2.4.41 update. One of the CVEs addressed was that of a malicious client that could perform a Denial of Services attack by flooding a connection with requests and basically never reading responses on the TCP connection. The new version also improves the balancer-manager protection against XSS/XSRF attacks from trusted users. The x86 emulation library fixed a compiler warning in the 2.4 version and the X11 RandR utility updated the geometry text file configure.ac for gitlab migration with the xrandr 1.5.1 version. The snapshot is trending at a rating of 86, according to the Tumbleweed snapshot reviewer.
