The upcoming Firefox 70 release will update the security and privacy indicators in the URL bar.

In recent years we have seen a great increase in the number of websites that are delivered securely via HTTPS. At the same time, privacy threats have become more prevalent on the web and Firefox has shipped new technologies to protect our users against tracking.

To better reflect this new environment, the updated UI takes a step towards treating secure HTTPS as the default method of transport for websites, instead of a way to identify website security. It also puts greater emphasis on user privacy.
