Brave browser is an interesting take as a privacy-focused browser. Even though we already have plenty of options to consider for Linux (Chromium/Firefox, etc.), the Brave browser stands out for things like strictly blocking ads and trackers.

It was in the beta phase before the announcement. So, if you already had it installed, you may not find a significant change with this release.

If you are learning about this browser for the first time, I shall mention a few key highlights associated with this release.
