MX Linux MX-19 petito feo - The longest mile

Well, well, well. MX linux MX-19 petito feo is a nice distro. It has a lot of great elements. But ... it also has a lot of annoyances as well as problems that weren't there in the previous edition. Overall, you get very decent connectivity and media out of the box, and the live session data save is a big plus. That said, Samba sharing ease is not there anymore, and the Firefox profile wasn't ported. Customization was quite annoying, and there were actual application errors.

I do like MX Linux, and it is improving in many aspects. It feels cleaner, more consistent, the MX Tools package is becoming more useful and powerful, and the application selection is respectable. But these are offset with problems that didn't exist in the past, and they make me feel that the development team might have found themselves trapped, plateauing. I hope this is a one-time glitch. All in all, 7.75-8/10, definitely worth testing, but for now, I believe Continuum was better put together, by ever so slight margin. Let's hope this ain't the end of a long, beautiful run. To be continued.
