First thing first, Falkon is not a new web browser. It has been in development since 2010 but it was known as Qupzilla.

In 2017, QupZilla moved under KDE umbrella and changed its name to Falkon. Being under KDE umbrella means that project is actively maintained following KDE standards.

It uses the QtWebEngine rendering engine ? which is a striped down version of Chromium core.

In this article, I shall take a closer look at what it offers and how it's different than other dominant web browsers on Linux out there.
