I have collected a lot of email addresses over the course of my, well, life so far. And managing all that data can be a bit of a pain. There are web-based services, but they aren't as fast as a local copy.

A few days ago, I talked about `vdirsyncer` for managing calendars. `Vdirsyncer` also handles contacts using the CardDAV protocol. `Vdirsyncer` supports `google_contacts` and `carddav` to do contact synchronizations in addition to the filesystem store it uses for calendars, but the `fileext` setting will change, so you won't be trying to store contacts in calendar files.
