GIMP 2.10.18 comes three months after version 2.10.14, which probably most of you out there are running on your GNU/Linux distributions, but the development team released version 2.10.16 a week ago without announcing anything official. Now, GIMP 2.10.18 is here, and we finally have details about the new features that were implemented during this cycle.

Without any further ado, the highlights of the GIMP 2.10.18 release include a new 3D Transform tool to let users rotate and pan items in 3D space (you can check it out in action below), a new high-contrast symbolic theme, a new ?Composited Preview? option for most transformation tools, and the ability to group tools by default in the toolbox, which is enabled by default after you update to this version.
