It's been more almost six months since the last Porteus Kiosk release and the team lead by Tomasz Jokiel proudly unveiled today a new major series of the Gentoo-based operating system that lets you transform a computer into a versatile and flexible kiosk system.

Porteus Kiosk 5.0 includes major software upgrades, starting with the kernel, which has been updated to the long-term supported Linux 5.4 series. Linux kernel 5.4.23 LTS is included in this first release of the 5.0 series, adding better support for newer hardware and many other benefits.
