Remember PC-BSD? As a desktop, FreeBSD-based operating system, It's effectively dead.

Here's a summary of what happened.

For a long time, PC-BSD was the lone, usable, for most users, BSD distribution targeted at desktop users, with KDE as the desktop environment of choice. And it remained that way until 2017 when the developers started their own desktop environment called Lumina. The first iterations were terrible. At some point there was a server-oriented implementation called TrueOS. By 2018, the direction of the project had changed, with the merging of both projects under the TrueOS brand. By the end of that year, the desktop end of the project under the TrueOS name was effectively dead, and by early 2019, the first edition of the project under the Project Trident name was released, still with Lumina as the desktop environment.
