Firefox OS, formerly known as Boot2Gecko, was Mozilla's attempt at establishing a mobile operating system. First designed as an open alternative to the rising Android and iOS operating systems, then with a focus on connected devices instead.

Mozilla announced the end of commercial development of Firefox OS in 2016 and to release the code as an open
KaiOS Technologies picked up the source and used it as a central component for the company's KaiOS operating system. The company had some success with the operating system as it is used on "more than 120 million devices" in "over 100 countries" according to KaiOS Technologies. KaiOS focuses on feature-phones, a market that Mozilla did not really entered when it worked on Firefox OS.
