Smartphones haven’t really needed a full computer keyboard, until now. We are turning the Linux desktop ecosystem into a convergent one. In order to access desktop applications, our keyboard has to feel good on the small screen, as well as expose common desktop keystrokes.

While you can comfortably use the GUI in PureOS, the terminal is fully empowered. Giving you all your favorite GNU commands, anything missing is likely an install command away. Actually using a terminal on a smartphone poses a few challenges. Displaying on a smaller screen size was solved easily by adding a touch-friendly zoom function.
