Needless to say, the security flaw, which is tracked as CVE-2019-0090, is worrying for everyone whose devices might be impacted, especially as the number of exploits launched by attackers with local access could grow in the short term.

But if you’re using a Librem Linux laptop launched by Purism, you’re perfectly safe, as the company says its implementation of the Intel ME doesn’t allow an attacker to exploit the flaw on its Intel-based computers.
