Finding the best operating system always depends on the purpose and our work domain. If we need an OS for hacking, digital investigation, or forensics, we mostly opt for Linux-based distributions. And if we search for the best Linux distro for the same, we always encounter Kali Linux or Parrot.

But it doesn't mean that other distros are bad. There are various operating systems available that are also rising in the forensics and cyber investigation industry. Recently, I've been discovering other alternatives to Kali Linux and the first distro I covered lately was CSI Linux. Now, I want to introduce Tsurugi Linux – another Linux-based OS for the Cyber forensics and OSINT (Open Source Intelligence), which released its 2020.1 ‘Spring Edition’ last week.
