There are many Linux distributions nowadays. Some are unique, but many are largely repetitive and probably don't need to exist. One Linux-based operating system that manages to stand out is Bodhi, thanks to its use of the Moksha desktop environment.

If you aren't familiar with Bodhi, please know it is a lightweight operating system that is based on the great Ubuntu. Today, Bodhi 5.1.0 becomes available. This new version is significant, as it is the first release since development leadership was changed last year.
