There is No "Linux" Platform (Part 2)

By Roy Schestowitz
Created 26/03/2020 - 3:39am
The problems outlined in Part 1 are of course not new, and people have been working on solutions to them for a long time. Some of these solutions have really started to come together over the last few years, empowering the people making the software to distribute it directly to the people using it.

Thanks to the work of many amazing people in our community you can now develop an app in GNOME Builder, submit it to Flathub, get it reviewed, and have it available for people to install right away. Once it’s on there you can also update it on a schedule you control. No more waiting 6 months for the next distribution release!
