AryaLinux focuses on the skill sets of advanced Linux users. This user class generally prefers to decide what to put on a system. These users also want to curate their own software.

The other prominent appeal of this distro is its derivative roots. It is not remastered or forked from any other Linux project. It is a unique Linux computing platform. It comes with the added feature of being a springboard to creating your own distro spin.

AryaLinux needs at least 20 GB of local storage for the system partition, as well as (for 2 GB of RAM or less) a swap partition of at least 2 GB, which also is used for hibernation mode.
