Debian developers are wanting to do their part to take on the global coronavirus pandemic by hosting a COVID-19 Biohackathon.

This virtual event organized by Debian developers is taking place from 5 to 11 April. Their hope with this biohackathon is to "improve biomedical FOSS and the tools/libraries that support those projects."

Among the work they hope to see realized from this hackathon are addressing various bugs, contributing to upstream biomedical open-source software, and related work.
