Hardware is important when selecting a new desktop computer, but so is the software that drives the experience. You need to know there are applications you can rely on for your workflow. What can you use to browse the web, edit a spreadsheet, watch a movie, or play a game? PureOS, which empowers all our hardware, has plenty of software that respects your freedom and can get the job done.

The default browser on PureOS is the Extended Support Release of Firefox. This gives you the stable base of Firefox with at least a year of support on each version. Firefox puts an emphasis on security and is licensed under a weak copyleft license called the MPL.
