A Linux distribution on the desktop is an amalgam of the tortoise and the little train that could. Ever so slowly, it continues to move onward and upward, ticking away the market share percentages by a tenth of a point at a time. No matter how slow that journey is, the developers of each distribution will keep going until their version of Linux has finally become accepted by the masses?at which point, one Linux distro will rule them all. Until then, the Linux community will continue to enjoy numerous distributions, ready to take over your desktop. But of those hundreds (nay, thousands) of desktops available, which are the best Linux desktop distributions?

After using all flavors of Linux distributions, including Red Hat, Zorin OS, Kali Linux Debian, CentOS, and more, for over 20 years, I've pretty much seen every type of distribution possible. That much exposure to a specific operating system makes it rather easy to come up with a list of which Linux desktop distributions are the best. And with that in mind, this is my list of Linux distributions that are best suited for overall usage. Remember, this is for the desktop, so server distributions like Red Hat Enterprise Linux, CentOS, Kali Linux, and SUSE Linux aren't in the mix.
