Talking to PC gamers about Linux is always entertaining, because everyone who knows even a little bit about Linux has a different impression. For some it's that other operating system they've vaguely heard of, and they have about as much interest in it as I have in cars (read: not much). For others it's a critical part of their work or infrastructure, or it's the thing their techy friend somehow always manages to bring up in unrelated conversations (ugh, you know how to do everything on the command line, we get it).

Last year I decided to become one of the latter and go all-in on desktop Linux. It opened my eyes to how much Linux has changed over the years, and how outdated the idea of Linux as an OS exclusively for tech nerds really is. Not only was the switch relatively painless, but I'm not missing out on much, either?not even gaming.

Here's what it's like switching from Windows to Linux today, from hardware to software to gaming.
