I’ve made a new ‘mini’ version of ExTiX – The Ultimate Linux System. It is based on (upcoming) Ubuntu 20.04 LTS Focal Fossa. The ISO file is now of 1050 MB, which is good if you want to run the system super fast from RAM. When the boot process is ready you can eject the DVD or USB stick. Use Boot alternative 2 or Advanced options? >> load to RAM. The best thing with ExTiX 20.4 is that while running the system live (from DVD/USB) or from hard drive you can use Refracta Snapshot (pre-installed) to create your own live installable Ubuntu 20.04 system. So easy that a ten year child can do it! ExTiX 20.4 uses the latest kernel ? 5.6.2. Released by Kernel.org today.

Study all pre-installed packages in ExTiX 20.4.
