We are living in exciting times, don’t you think? Interstellar objects are visiting our galaxy. Astronomers are winning Nobel. History is being made in so many fields of Astronomy. Thanks to the advancements in computers and technology, today, anyone can indulge in amateur level astrophotography. You just need the right equipment, a few addons, and you are all set.

However, before you set your eyes at the Saturns rings, Martian ice-caps, or Jupiter’s moons, you need to learn the basics of Computerized Telescopes. Worry not, if you don’t know what those are. We will be covering all that in the buyer’s guide section. While the computers in most popular brands support windows, in this article, we will be reviewing the top 5 best computerized telescopes that support Linux too. So let’s begin!

[2] Linux
