Today, I?m excited to share some big news with you?Fedora Workstation will be available on Lenovo ThinkPad laptops! Yes, I know, many of us already run a Fedora operating system on a Lenovo system, but this is different. You?ll soon be able to get Fedora pre-installed by selecting it as you customize your purchase. This is a pilot of Lenovo?s Linux Community Series ? Fedora Edition, beginning with ThinkPad P1 Gen2, ThinkPad P53, and ThinkPad X1 Gen8 laptops, possibly expanding to other models in the future.

The Lenovo team has been working with folks at Red Hat who work on Fedora desktop technologies to make sure that the upcoming Fedora 32 Workstation is ready to go on their laptops. The best part about this is that we?re not bending our rules for them. Lenovo is following our existing trademark guidelines and respects our open source principles. That?s right?these laptops ship with software exclusively from the official Fedora repos! When they ship, you?ll see Fedora 32 Workstation. (Models which can benefit from the NVIDIA binary driver can install it in the normal way after the fact, by opting in to proprietary software sources.)
