Are you someone who uses a lot of copy and paste functions between several documents in your day to day usage? If so, then Clipboard Indicator should become one of your go-to solutions. Install Clipboard Indicator as a GNOME extension to your Linux distribution. In my experience, it has a minimum performance impact on GNOME Shell at least, less than other solutions I have tried.

This tool adds an indicator menu to the top panel and caches your clipboard history. You can set the history size, preview the number of characters you want to view. It shows notifications on copy and acts as a temporary space to store whatever you copy.
