OpenSUSE Leap 15.2 is complete and ready for a planned release on July 2. Leap is the version based on SUSE Linux Enterprise, but with many updated packages; see the 15.2 features page for an overview of what's coming. "Leap 15.2 is filled with several containerization technologies like Singularity, which bring containers and reproducibility to scientific computing and the high-performance computing (HPC) world. Singularity first appeared in the Leap distribution in Leap 42.3 and provides functionality to build smallest minimal containers and runs the containers as single application environments. Another official package in Leap 15.2 is libcontainers-common, which allows the configuration of files and manpages shared by tools that are based on the github.com/containers libraries, such as Buildah, CRI-O, Podman and Skopeo. Docker containers and tooling make building and shipping applications easy and fast."
