Nextcloud GmbH has announced the immediate availability of the Nextcloud Desktop Client v3.0. This new release marks the availability of the company’s end-to-end encryption technology across its mobile and desktop clients and the introduction of a new user interface with a deeper integration of Nextcloud Hub in the desktop experience of users.

The new interface for the desktop client makes Talk and other apps on the Nextcloud server easier to access for desktop users. A click on the icon in the system tray pops up a new menu, showing a list of events on the server with on top user account information, a link to Files, Talk and a button that brings a list of other apps.

From the list of server activity, users can directly access the sharing settings of a file. In the file manager, a right-click on a document now gives the option to edit directly in the online office document editor in Nextcloud.

Kiwi TCMS container images now available via Red Hat Quay.io [3]

Hello testers, we have very important news around how container images for Kiwi TCMS will be distributed! Recently Docker. has announced several changes in their storage plans which makes it less viable for our team to continue using their services in full!

curl 7.72.0 ? more compression [4]
Welcome to another release, seven weeks since we did the patch release 7.71.1. This time we add a few new subtle features so the minor number is bumped yet again. Details below.

- **Nominations still open for TDF’s Membership Committee!** [5]

  Are you a Member of The Document Foundation, the non-profit entity behind LibreOffice? Want to get more involved in the foundation, and help to shape its future? Apply to become part of the Membership Committee (MC)!

  By being part of the MC, you can work with the people at the core of the LibreOffice community: the TDF members. It’s also a good chance to understand how the international community and foundation works behind LibreOffice, the leading FOSS office suite. Learn more about the current MC here.

- **SmartArt improvements in Impress, part 5** [6]

  This builds on top of the previous improvements around SmartArt support. First, thanks to our partner SUSE for working with Collabora to make this possible.
