- Kodachi 7.3 The Secure OS [2]

Linux Kodachi operating system is based on Xubuntu 18.04.5 it will provide you with a secure, anti-forensic, and anonymous operating system considering all features that a person who is concerned about privacy would need to have in order to be secure.

Kodachi is very easy to use all you have to do is boot it up on your PC via USB drive then you should have a fully running operating system with established VPN connection + Service running. No setup or knowledge is required from your side its all been automated for you. The entire OS is functional from your temporary memory RAM so once you shut it down no trace is left behind all your activities are wiped out.

The Guix hackers are very happy to announce the first online Guix Day Conference on Sunday November, 22nd. This conference is open to everyone and will be held entirely online. Want to speak? Submit your proposal!

- Cameron Kaiser: TenFourFox FPR28 available [4]

TenFourFox Feature Parity Release 28 final is now available for testing (downloads, hashes, release notes). Since there are a couple more user-facing features landing hopefully for FPR29 out of some great work by OlgaTPark, we've temporarily held Raphaël's Enable JavaScript
menu option since these will both require new locale strings and I'd rather not release two language pack sets back to back. Both features will instead debut officially in FPR29 with new langpacks side-by-side, along with some targeted Gecko fixes which should improve site compatibility as well.
