- [Refreshed UI For Fedora Media Writer](#) [2]

For those who don't know, Fedora Media Writer is a tool to create bootable live USB drive with your favorite flavor of Fedora. It is written in C++ with UI written in QML and it is supported on Linux, Windows and Mac OS X. It was developed by Martin Bříza, my former colleague from Red Hat, who did an amazing job in the past. Fedora Media Writer (FMW) primarily targets Fedora Workstation and therefore the UI looks like a GNOME app using Adwaita theme. Unfortunately the Adwaita theme changed over time and originally FMW was written using QtQuickControls 1 (deprecated these days) so it needed an UI overhaul.

- [F33-20201113 updated isos released.](#) [3]

The Fedora Respins SIG is pleased to announce the latest release of Updated F33-20201113-Live ISOs, carrying the 5.8.18-200 kernel.

Some say Friday the 13th is unlucky, but we can say otherwise with this release.

This set of updated isos will save considerable amounts of updates after install. ((for new installs.)(New installs of Workstation have about 800MB+ of updates)).
