The latest bit of obscure hardware support set to arrive with Linux 5.11 are the PlayStation 3 and Nintendo Wii U dongles for the Guitar Hero Live.

Should you be wanting to use a Guitar Hero Live device connected to your Linux system by means of a PlayStation 3 or Nintendo Wii U wireless dongle, that support will work early next year with Linux 5.11.

Support has been queued into the hid-next code ahead of December's Linux 5.11 merge window. The PS3/Wii-U dongles share the same IDs for identifying the device, but beyond adding the device IDs there is some extra steps needed for support.
