Just a quick shout-out to Tobias who just released version 1.0.0 of KGeoTag. As you can probably guess from the version number, KGeoTag is quite a young project - though it already has some nice features.

You can use KGeoTag to assign image files to GPS locations. This can help you with remembering the exact location where a photo was taken, or with discovering images that were taken at the same place. Of course, this is most useful
when used together with another program such as KPhotoAlbum, that can adequately display this information and lets you search by GPS coordinates 😊.
