How to ?un-google? your Chromium browser experience

By Roy Schestowitz

On March 15th 2021, Google is going to block non-Google chromium-based browsers from accessing certain ?private Google Chrome web services? by unilaterally revoking agreements made with 3rd parties in the past. Meaning, every Chromium based product not officially distributed by Google will be limited to the use of only a few public Google Chrome web services.

The most important service that remains open is ?safe browsing?. The safe browsing feature identifies unsafe websites across the Internet and notifies browser users about the potential harm such websites can cause.

The most prominent feature which will be blocked after March 15th is the ?Chrome Sync?. This Chrome Sync capability in Chromium based browsers allows you to login to Google?s Sync cloud servers and save your passwords, browsing history and bookmarks/favorites to your personal encrypted cloud vault inside Google?s infrastructure. Extremely convenient for people who access the Internet using multiple devices (like me: Chrome on a few Windows desktops, Chromium on several Slackware desktops and laptop and Chrome Mobile on my Android smartphone) and who want a unified user experience in Chrome/chromium across all these platforms.
