Today, Canonical released Ubuntu 21.04 with native Microsoft Active Directory integration, Wayland graphics by default, and a Flutter application development SDK. Separately, Canonical and Microsoft announced performance optimization and joint support for Microsoft SQL Server on Ubuntu.

"Native Active Directory integration and certified Microsoft SQL Server on Ubuntu are top priorities for our enterprise customers," said Mark Shuttleworth, CEO of Canonical. "For developers and innovators, Ubuntu 21.04 delivers Wayland and Flutter for smoother graphics and clean, beautiful, design-led cross-platform development."

Ubuntu has established itself as the enterprise engineering platform of choice, from the desktop to public cloud and microservices, with a wide range of corporate adopters in the finance, automotive, tech and government sectors.

"Canonical’s desktop solutions are cost-effective, easy to manage at scale, and simple to integrate with enterprise systems. For our 100,000 police officers, Ubuntu is user-friendly, reliable, and delivers the requisite privacy and security without additional third-party solutions. Ubuntu is our operating system of choice," said Lt-Colonel Stéphane Dumond, French Gendarmerie Nationale.
