Java is still the most famous and trusted programming language for developers. In recent years java is evolving and coming with new features like Frameworks, Java Enterprise Edition that simplify the development of enterprise applications. With the help of a framework, java provides the best solutions for any domain: banking, e-commerce, big data, finance, etc. Frameworks provide a pre-developed code as a template, which a developer can use for creating an application by filling in their code. Java frameworks help the developers to focus more on business logic instead of worrying about general functionalities like exception handling, database connection, etc. Although we have various frameworks developed on java, we will discuss some best and very commonly used frameworks in this article.
