Since the last report two month ago we saw the 21.04.0 release of Kontact, and again integrate more than 1400 changes by more than 30 contributors. Here are some of the highlights.

**Kontact**

A large focus remains preparing the upcoming migration to Qt6 and KF6. This mainly consists of porting away from deprecated functionality in Qt and KDE Frameworks, as well as language features that are incompatible with C++17. While not having any visible impact right now, this will allow for a smoother transition down the line.

Not only code needs to be updated, Carl also updated and extended a tutorial on how to develop Akonadi-based applications from the KDE4 era.
