On this episode of This Week in Linux, we’ve got a ton of news to cover with some big news from Audacity in that the project has been acquired by the Muse Group, Ubuntu 16.04 Reaches End of LIfe . . . well sort of. Then we’ll check out some great hardware news from IBM & also from Star Labs. In App News this week, we’ve got new releases from MusE Digital Audio Workstation, Kdenlive 21.04, QEMU 6.0 and more. We’re also going to do a follow up to some news last week related to Humble Bundle and so much more including new version of WINE and Proton and even a milestone for the Linux kernel to celebrate. All that and much more on Your Weekly Source for Linux GNews!

Termite Is Dead. Dev Lashes Out At GNOME.

The popular VTE-based terminal emulator known as Termite is now officially dead. The main dev has decided to stop working on Termite. He is telling everyone to switch to Alacritty and help contribute to that project. He also has some not-so-nice things to say about the GNOME project, which maintain VTE.
In various privacy oriented tech circles you'll here the term botnet be thrown around to refer to anything that makes network connections and does something in response so today I thought I should take the time to explain what a botnet actually is.
