For months Linux hardware vendor System76 has been teasing their own in-house designed and manufactured keyboard with open-source firmware and various innovations. Today the embargo lifts on the System76 Launch Configurable Keyboard so we can share more about this new open hardware product.

The System76 Launch Configurable Keyboard is their latest product being designed and manufactured from their facility in Denver, Colorado -- the second after their Thelio line of desktop computers. The keyboard base is an open-source design and milled out of aluminum. The CAD design and drawings are open-source on GitHub for those with the necessary equipment to fabricate your own. The Launch Keyboard also makes use of their own, open-source PCB design that supports individual RGB LED key backlighting and other features.
