Sailfish OS is a Linux-based operating system for mobile devices that made its debut on the Jolla Phone, which first shipped in 2013. Jolla shifted its focus from hardware to software years ago, and with Sailfish OS 4.1 rolling out now, the company says it's ending support for the original Jolla Phone.

Sailfish OS 4.1 does, however, support a number of newer devices including the Jolla C, Jolla Tablet, and several Sailfish Xperia smartphones as well as the Planet Computers Gemini PDA.

The latest version of Sailfish OS also brings a number of bug fixes and a handful of new apps and features.
