While past the Linux 5.13 merge window, some reorganizing/cleaning to the AMD Secure Encrypted Virtualization (SEV) code was merged to mainline today to make it easier for when the SEV-SNP and other feature code is submitted for Linux 5.14 or later.

While post merge window activity is normally limited to bug/regression fixes for the Linux kernel, some reorganization to the SEV code was merged today ahead of Linux 5.13-rc2. The basis for merging the code now is that it will vastly improve the experience when it comes time to landing new feature code moving forward. Most notably, the SEV-SNP code is out under review and those patches will depend upon this reorganized SEV kernel code.
