Cambalache is a new RAD tool that enables the creation of user interfaces for Gtk and the GNOME desktop environment, it's main focus is on the newly released Gtk 4 library but it has been designed from the ground up to support other versions.

It started as a proof of concept data model for Glade meant to try out all the crazy ideas I had during the years about
how a clean model should be.

A few months later I had a pretty good data model that matched GObject type system quite well and did not depend on GtkBuilder nor GObject.
