Three years after Chrome OS first started offering support for Linux apps, the feature is leaving beta, the search giant announced during a Google I/O 2021 developer session. It's happening in Chrome OS's next release, which Android Central notes is version 91, due to enter the stable channel in the next couple of weeks.

Chrome OS as an operating system has always been based on Linux, but since 2018 its Linux development environment has offered access to a Linux terminal, which developers can use to run command line tools. The feature also allows full-fledged Linux apps to be installed and launched alongside your other apps. In addition to Linux apps, Chrome OS also supports Android apps.
